1-(4-PIPERIDINYL)BENZIMIDAZOLONES AS HISTAMINE H<sub>3</sub> ANTAGONISTS

10

FIELD OF THE INVENTION

The present invention relates to novel substituted benzimidazolones, and aza- and diaza-derivatives thereof, useful as histamine H<sub>3</sub> antagonists. The invention also relates to pharmaceutical compositions comprising said compounds and their use in treating inflammatory diseases, allergic conditions and central nervous system disorders. The invention also relates to the use of a combination of novel histamine H<sub>3</sub> antagonists of this invention with histamine H<sub>1</sub> compounds for the treatment of inflammatory diseases and allergic conditions, as well as pharmaceutical compositions comprising a combination of one or more novel histamine H<sub>3</sub> antagonist compounds of the invention with one or more histamine H<sub>1</sub> compounds.

BACKGROUND OF THE INVENTION

The histamine receptors, H<sub>1</sub>, H<sub>2</sub> and H<sub>3</sub> are well-identified forms. The H<sub>1</sub> receptors are those that mediate the response antagonized by conventional antihistamines. H<sub>1</sub> receptors are present, for example, in the ileum, the skin, and the bronchial smooth muscle of humans and other mammals. Through H<sub>2</sub> receptor-mediated responses, histamine stimulates gastric acid secretion in mammals and the chronotropic effect in isolated mammalian atria.

H<sub>3</sub> receptor sites are found on sympathetic nerves, where they modulate sympathetic neurotransmission and attenuate a variety of end organ responses under control of the sympathetic nervous system. Specifically, H<sub>3</sub> receptor activation by histamine attenuates nonepinephrine outflow to resistance and capacitance vessels, causing vasodilation.

Imidazole H<sub>3</sub> receptor antagonists are well known in the art. More recently, non-imidazole H<sub>3</sub> receptor antagonists have been disclosed in WO 02/32893 and WO 02/072,570.

US 5,869,479 discloses compositions for the treatment of the symptoms of allergic rhinitis using a combination of at least one histamine H<sub>1</sub> receptor antagonist and at least one histamine H<sub>3</sub> receptor antagonist.

10 represents straight and branched carbon chains and contains from one to six carbon atoms;

alkylene represents a divalent straight or branched alkyl chain, e.g., ethylene ( $\text{-CH}_2\text{CH}_2\text{-}$ ) or propylene ( $\text{-CH}_2\text{CH}_2\text{CH}_2\text{-}$ );

Haloalkyl or haloalkoxy represent alkyl or alkoxy chains as defined above  
15 wherein one or more hydrogen atoms are replaced by halogen atoms, e.g.,  $\text{-CF}_3$ ,  $\text{CF}_3\text{CH}_2\text{CH}_2\text{-}$ ,  $\text{CF}_3\text{CF}_2\text{-}$  or  $\text{CF}_3\text{O-}$ ;

20 carbocyclic group being intended as possible points of attachment;

arylalkyl represents an aryl group, as defined above, bound to an alkyl group, as defined above, wherein said alkyl group is bound to the compound;

cycloalkyl represents saturated carbocyclic rings of from 3 to 6 carbon atoms;

Also, as used herein, "upper airway" usually means the upper respiratory system--i.e., the nose, throat, and associated structures.

5       Also, as used herein, "effective amount" generally means a therapeutically effective amount.

A line drawn into a ring means that the indicated bond may be attached to any of the substitutable ring carbon atoms.

10       Certain compounds of the invention may exist in different isomeric (e.g., enantiomeric, diastereoisomeric and geometric) forms. The invention contemplates all such isomers both in pure form and in admixture, including racemic mixtures. Enol forms and tautomers are also included.

15       The compounds of this invention are ligands for the histamine H<sub>3</sub> receptor. The compounds of this invention can also be described as antagonists of the H<sub>3</sub> receptor, or as H<sub>3</sub> antagonists.

20       The compounds of the invention are basic and form pharmaceutically acceptable salts with organic and inorganic acids. Examples of suitable acids for such salt formation are hydrochloric, sulfuric, phosphoric, acetic, citric, oxalic, malonic, salicylic, malic, fumaric, succinic, ascorbic, maleic, methanesulfonic and other mineral and carboxylic acids well known to those skilled in the art. The salts are prepared by contacting the free base form with a sufficient amount of the desired acid to produce a salt in the conventional manner. The free base forms may be regenerated by treating the salt with a suitable dilute aqueous base solution such as dilute aqueous sodium hydroxide, potassium carbonate, ammonia and sodium bicarbonate. The free base forms can differ from their corresponding salt forms somewhat in certain physical properties, such as solubility in polar solvents, but the salts are otherwise equivalent to their corresponding free base forms for purposes of this invention.

30       Depending upon the substituents on the inventive compounds, one may be able to form salts with bases. Thus, for example, if there is a carboxylic acid substituent in the molecule, a salt may be formed with an inorganic as well as organic base such as, for example, NaOH, KOH, NH<sub>4</sub>OH, tetraalkylammonium hydroxide, and the like.

The compounds of formula I can exist in unsolvated as well as solvated forms, including hydrated forms, e.g., hemi-hydrate. In general, the solvated form, with pharmaceutically acceptable solvents such as water, ethanol and the like are equivalent to the unsolvated form for purposes of the invention.

30 Compounds of the present invention can be prepared by a number of ways evident to one skilled in the art. Preferred methods include, but are not limited to, the general synthetic procedures described herein. One skilled in the art will recognize that one route will be optimal depending on the choice of appendage substituents. Additionally, one skilled in the art will recognize that in some cases the order of steps has to be controlled to avoid functional group incompatibilities. One such method for the preparation of compounds of formula I wherein R<sup>1</sup> is benzimidazolone is shown in Scheme 1 below. Similar procedures can be used to prepare the aza-

20   acid with a coupling reagent (e.g. DECI, DCC) with an amine at 0 °C to 100 °C. Suitable solvents for the reaction are halogenated hydrocarbons, ethereal solvents, dimethylformamide and the like.

          One skilled in the art will recognize that the synthesis of compounds of formula XVI may require the construction of an amine bond. Methods include but are not  
25   limited to the reaction of an amine with a reactive carbonyl (e.g. aldehyde or ketone) under reductive amination conditions. Suitable reducing reagents for the reaction include NaBH<sub>3</sub>CN, sodium triacetoxyborohydride and the like at 0 °C to 100 °C. 10 distillation, crystallization, chromatography and the like. Such materials can be characterized using conventional means, including physical constants and spectral data.

SCHEME 1. General Method for Preparation of Compounds of Formula XVI

(Steps D', E', F', G' are optional)

Step A: A suitably mono-protected amine of formula **X** is alkylated with a halide to form a compound of formula **XII**. A suitable halide for alkylation is a substituted 2-bromo nitrobenzene as described by Henning et al, *J. Med. Chem.* 30, (1987) 814. Suitable amine protecting groups are methyl, benzyl, ethoxycarbonyl or the like.

5 Step B: A suitably protected ketone of formula **XI** is reductively alkylated with an amine to form a compound of formula **XII**. Suitable amine protecting groups are methyl, benzyl, ethoxycarbonyl or the like

Step C: An intermediate diamine of formula **XII** is then cyclized with an appropriate carbonyl equivalent such as phosgene, triphosgene or carbonyl diimidazole (CDI) to  
10 form a compound of formula **XIII**. Methods for cyclization have been described by Henning et al, *J. Med. Chem.* 30, (1987) 814.

Steps D & D': The protected amine of formula **XIII** is deprotected using methods known to those skilled in the art. See, for example, Green et al, *Protective Groups in Organic Synthesis*. A suitable method for methyl deprotection is reaction with a  
15 haloformate or the like. A suitable method for benzyl deprotection is cleavage with hydrogen at or above atmospheric pressure and a catalyst such as palladium. A suitable method for carbamate deprotection is treatment with an acid such as HCl.

Optionally, when R is H in formula **XIII**, derivatization can be accomplished before other steps by methods known to those skilled in the art. Preferred methods  
20 include, but are not limited to, alkylation with a halide under phase transfer conditions (e.g. biphasic basic conditions) or arylation with an aryl or heteroarylboronic acid under metal catalyzed conditions.

Steps E & E': An amine of formula **XIV** is reacted with an activated functional group to form the bond between the nitrogen and functional group Y in formula **XV**. When Y  
25 is a carbonyl group and M<sup>2</sup> is carbon, activation can be via a halide (i.e. acid chloride intermediate) and suitable reaction conditions may require a base such as triethylamine. When Y is a methylene and M<sup>2</sup> is a carbon, activation can be via a halide (i.e. iodomethyl intermediate) or an acid chloride as above followed by treatment with a reducing agent such as LAH. When Y is a sulfonyl and M<sup>2</sup> is a  
30 carbon, activation can be via a sulfonyl halide (i.e. sulfonyl chloride intermediate).

Optionally, when R is H in formula **XIV**, derivatization can be accomplished before other steps by methods known to those skilled in the art.

Steps F & F': The protected amine of formula **XV** is deprotected using methods known to those skilled in the art. A suitable method for methyl deprotection is reaction

with a haloformate or the like. A suitable method for benzyl deprotection is cleavage with hydrogen at or above atmospheric pressure and a catalyst such as palladium. A suitable method for carbamate deprotection is treatment with an acid such as hydrochloric acid. The deprotected amine intermediate formed above is then  
 5 alkylated with a suitable reagent such as halide-Z-R<sup>2</sup> to form the bond between nitrogen and Z in compound **XVI**.

Optionally, when R is H in formula **XV**, derivatization can be accomplished before other steps by methods known to those skilled in the art.

Steps G & G': An amine of formula **XIV** is reacted with an activated functional group  
 10 to form the bond between the nitrogen and functional group Y in formula **XV**. When Y is a carbonyl group and M<sup>2</sup> is carbon, activation can be via a halide (i.e. acid chloride intermediate) and suitable reaction conditions may require a base such as triethylamine. When Y is a methylene and M<sup>2</sup> is a carbon, activation can be via a halide (i.e. iodomethyl intermediate) or an acid chloride as above followed by  
 15 treatment with a reducing agent such as LAH. When Y is a sulfonyl and M<sup>2</sup> is a carbon, activation can be via a sulfonylhalide (i.e. sulfonyl chloride intermediate).

Optionally, when R is H in formula **XIV**, derivatization can be accomplished before other steps by methods known to those skilled in the art.

The preparation of intermediates of formula **XIII** is further elaborated in the  
 20 following Schemes 2 and 3. Preparation of benzimidazoles is shown, but aza and diaza derivatives can be similarly prepared.

### Preparation 1

10 Step 1: To a solution of ethyl isonipecotate (147 g, 0.93 mol) in dichloroethane (1300 ml) was added 4-pyridinecarboxaldehyde (50.0 g, 0.47 mol) and crushed 3 Å molecular sieves (35 g). After 10 min., NaBH(OAc)<sub>3</sub> (198 g, 0.93 mol) was added, portionwise, and the reaction stirred at 23 °C. After 16 h, water (300 ml) was slowly  
15 added, the organic layer separated, and the aqueous layer extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic extracts were dried (MgSO<sub>4</sub>), filtered, and concentrated. The crude product was distilled under vacuum to afford 101.5 g (0.409 mol, 91%) of the desired compound as an oil (bp 148-150 °C @ 3 mm Hg). MS (ES) m/e 249 (MH<sup>+</sup>).

20 Step 2: To a solution of the product of Step 1 (101.5 g, 0.409 mol) in CH<sub>3</sub>OH (1000 ml) was added LiOH monohydrate in H<sub>2</sub>O (1.0 M, 860 ml, 0.86 mol). The reaction was heated at reflux for 16 h, then concentrated. The remaining water was removed azeotropically with EtOH (3 x 300 ml) to give 104.5 g (0.384 mol, 94%) of the compound of Preparation 1 with LiOH as a white solid. MS (ES): m/e 221 (MH<sup>+</sup>).

### Preparation 2

To a solution of ethyl isonipecotate (15.0 g, 95.4 mmol), was added 4-acetylpyridine (9.25 g, 76.3 mmol) and titanium isopropoxide (27.12 g, 95.4 mmol). The reaction was stirred at 23 °C for 16 h, and then EtOH (300 ml) and NaCNBH<sub>3</sub> (6.00 g, 95.4 mmol) were added. After an additional 24 h, water (300 ml) and CH<sub>2</sub>Cl<sub>2</sub> (300 ml) were added. The reaction was filtered through celite and washed with water (300 ml) and CH<sub>2</sub>Cl<sub>2</sub> (300 ml). The filtrate was transferred to a separatory funnel, 1 N NaOH was added and the organic layer separated. The combined organic extracts were dried (MgSO<sub>4</sub>), filtered, and concentrated. Further purification by silica gel chromatography (eluant: 3% CH<sub>3</sub>OH – CH<sub>2</sub>Cl<sub>2</sub> then 6% CH<sub>3</sub>OH - CH<sub>2</sub>Cl<sub>2</sub>) afforded 8 g (28.9 mol, 38% yield) of the desired compound as a yellow oil. MS (FAB for M+1): m/e 277. This compound was hydrolyzed with LiOH monohydrate as in Preparation 1 to afford the compound of Preparation 2.

The following compound was prepared according to the same above procedure:

Preparation 2A: MS (ES): m/e 291 (MH<sup>+</sup>).

#### Preparation 3

To a solution of diisopropylamine (2.28 g, 3.2 ml, 22.55 mmol) in dry THF (50 mL) at 0 °C under N<sub>2</sub> was added n-butyl lithium (2.5 M, 8.4 ml, 20.94 mmol) via syringe. After 10 min, the reaction was cooled to -78 °C and the product of Preparation 1, Step 1 (4.00 g, 16.11 mmol) in dry THF (10 ml) was added dropwise via an addition funnel. After 3 h at -78 °C, N-fluorobenzenesulfonimide (6.60 g, 20.94 mmol) was added, and the reaction was then allowed to warm slowly to 23 °C overnight. The reaction was quenched by addition of 0.5 N NaOH (100 ml) and extracted with EtOAc. The combined organic extracts were dried (MgSO<sub>4</sub>), filtered, and concentrated. Purification by silica gel chromatography (eluant: 2% CH<sub>3</sub>OH –

CH<sub>2</sub>Cl<sub>2</sub> then 3% CH<sub>3</sub>OH – CH<sub>2</sub>Cl<sub>2</sub>) afforded 0.63 g (2.37 mmol, 15%) of the desired compound as a yellow oil. MS (FAB for M+1): m/e 267. This compound was hydrolyzed with LiOH monohydrate as in Preparation 1 to afford the compound of Preparation 3.

5

Preparation 4Step 1:

To a solution of 2-amino-4-methylpyridine (10.81 g, 100 mmol) in tert-butanol (250 ml) was added t-BOC anhydride (26.19 g, 120 mmol). The reaction mixture was stirred at 23 °C overnight, and then concentrated to an oil. The crude product was dry loaded onto a silica gel column and flash chromatographed (eluant: 30% hexanes-CH<sub>2</sub>Cl<sub>2</sub> to 0-2% acetone-CH<sub>2</sub>Cl<sub>2</sub>) to obtain 15.25 g (73.32 mmol; 73%) of the desired product as a white solid.

15

Step 2:

To a solution of the product of Step 1 (35.96 g, 173 mmol) in THF (1.4 l) at -78 °C was added n-BuLi (1.4 M, 272 ml, 381 mmol) in hexanes portionwise over 30 min. The reaction mixture was then allowed to warm slowly and was stirred for 2 h at 23 °C, which resulted in the formation of an orange precipitate. The mixture was then recooled to -78 °C, and pre-dried oxygen (passed through a Drierite column) was bubbled through the suspension for 6 h while the temperature was maintained at -78 °C. The color of the reaction mixture changed from orange to yellow during this time. The reaction was quenched at -78 °C with (CH<sub>3</sub>)<sub>2</sub>S (51.4 ml, 700 mmol) followed by AcOH (22 ml, 384 mmol) and allowed to warm slowly to room temperature. After 48 h, water was added and the product extracted into EtOAc. Purification by silica gel

25

flash chromatography (eluant: 0–15% acetone/ CH<sub>2</sub>Cl<sub>2</sub>) provided 20.15 g (90 mmol; 52%) of the alcohol as a pale yellow solid.

Step 3:

5 To a solution of the product of Step 2 (19.15 g, 85.5 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (640 ml) was added a saturated aqueous solution of NaHCO<sub>3</sub> (8.62 g, 103 mmol) and NaBr (444 mg, 4.3 mmol). The reaction mixture was cooled to 0 °C, and TEMPO (140 mg, 0.90 mmol) was introduced. Upon vigorous stirring, commercial bleach solution (122 ml, 0.7 M, 85.4 mmol) (5.25% in NaOCl) was added portionwise over 40  
10 min. After an additional 20 min at 0 °C, the reaction mixture was quenched with saturated aqueous Na<sub>2</sub>S<sub>2</sub>O<sub>3</sub> and allowed to warm to 23 °C. Dilution with water and extraction with CH<sub>2</sub>Cl<sub>2</sub>, followed by concentration and flash chromatography (eluant: 30% hexanes-CH<sub>2</sub>Cl<sub>2</sub> to 0-2% acetone-CH<sub>2</sub>Cl<sub>2</sub>) afforded 15.97 g (71.9 mmol; 84% yield) of the aldehyde as an off-white solid.

15 Step 4:

To a solution of the product of Step 3 (11.87 g, 53.5 mmol) in CH<sub>2</sub>Cl<sub>2</sub> (370 ml) was added ethyl isonipecotatate (9.07 ml, 58.8 mmol) followed by four drops of AcOH. The reaction mixture was then stirred for 40 min at 23 °C, after which NaB(OAc)<sub>3</sub>H (22.68 g, 107 mmol) was added. The reaction mixture was stirred overnight at 23 °C,  
20 neutralized with saturated aqueous NaHCO<sub>3</sub>, diluted with water and extracted with CH<sub>2</sub>Cl<sub>2</sub>. Concentration of the organic extracts, followed by silica gel flash chromatography (eluant: 0–4% sat. NH<sub>3</sub> in CH<sub>3</sub>OH-CH<sub>2</sub>Cl<sub>2</sub>) provided 19.09 g (52.6 mmol; 98%) of the ester as an off-white solid.

The reaction mixture was stirred at 23 °C for 2 h, concentrated, treated with water and CH<sub>2</sub>Cl<sub>2</sub>. The organic layer was separated, dried, and concentrated. After 22 h, the biphasic reaction mixture was transferred to a separatory funnel, and the product extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic extracts were washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. Purification by silica gel chromatography (eluant: 8:1 hexane:EtOAc) gave 3.02 g (10.1 mmol, 50% yield) of 5B as a colorless oil. MS: m/e 298.

To a solution of 5B (2.13 g, 7.14 mmol) in dry DMSO (12 ml) was added potassium thioacetate (1.23 g, 10.7 mmol). After 21.5 h, water was added and the product extracted into EtOAc. The combined organic extracts were washed with brine, dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. Purification by silica gel chromatography (eluant: 5:1 hexane:EtOAc) gave 1.36 g (4.7 mmol, 66% yield) of 5C as a yellow oil. MS: m/e 294.

Cl<sub>2</sub> (gas) was bubbled into a suspension of 5C (1.05 g, 3.58 mmol) in water (30 ml) at 0 °C. After 35 min, additional water was added, and the product extracted with Et<sub>2</sub>O. The combined organic extracts were washed sequentially with 5% Na<sub>2</sub>S<sub>2</sub>O<sub>5</sub> (100 ml), saturated NaHCO<sub>3</sub> (50 ml), and brine. The organic layer was dried (Na<sub>2</sub>SO<sub>4</sub>), filtered, and concentrated. After 16 h, the reaction was filtered, the solvent evaporated, and the residue redissolved in CH<sub>2</sub>Cl<sub>2</sub>. 0.5 N NaOH (30 ml) was added and the product extracted with CH<sub>2</sub>Cl<sub>2</sub>. The combined organic extracts were dried (MgSO<sub>4</sub>), filtered, and concentrated. Example 158

5 In a manner similar to that described for Intermediate 3, Step D', compound 158A was converted to compound 158B.

A solution of 158B (1.7g, 8.0 mmol) in ethylene glycol dimethyl ether (12 ml) was treated with tosylmethyl isocyanide (1.6 g, 8.0 mmol) and EtOH (1 ml), cooled to 0 °C, and treated with t-BuOK (2.2g, 16.0 mmol). The reaction mixture was stirred at  
 10 20 °C overnight, filtered through celite with EtOAc, and concentrated. Filtration through a plug of SiO<sub>2</sub> with EtOAc provided 158C as a yellow oil.

In a manner similar to that described for Intermediate 3, Step D, and then Preparation 4, Step 4, compound 158C was converted to compound 158D.

A solution of 158D (100 mg, 0.47 mmol) in EtOH (12 ml) was treated with  
 15 NaOH (310 mg, 8.0 mmol) and H<sub>2</sub>O (1 ml) and refluxed for 4 days. The reaction mixture was concentrated, slurried in EtOAc (20 ml), taken up in 4M HCl-dioxane and CH<sub>3</sub>OH, and concentrated to provide 158E.

In a manner similar to that described in Example 1, Step G, compound 158E  
 20 was converted to Example 158.

Example 159

In a manner similar to that described for Example 158, compound 159A was converted to compound 159B.

A solution of 159B (1.5g, 7.9 mmol) in EtOH (40 ml) was treated with 4M HCl-dioxane (20 ml) and stirred overnight. The reaction mixture was cooled to 0 °C, treated with saturated aqueous NaHCO<sub>3</sub> until neutralized, and extracted with EtOAc. The organic layer was dried over Na<sub>2</sub>SO<sub>4</sub> and concentrated. Flash chromatography (35-50% EtOAc/hexane) provided 159C (1.1 g, 58%).

A solution of 159C (210 mg, 0.85 mmol) in AcOH (10 ml) was treated with Pd(OH)<sub>2</sub> (100 mg) and stirred under H<sub>2</sub> overnight. The reaction mixture was filtered through celite and concentrated to provide 159D.

In a manner similar to that described in Preparation 4, Step 4-5 and Example 1, Step G, compound 159D was converted to compound Example 159.

Using the procedures described above for Examples 1-159, compounds of the following structure were prepared:

### General Procedure for H<sub>3</sub>-Receptor Binding Assay

The source of the H<sub>3</sub> receptors in this experiment was guinea pig brain. The animals weighed 400-600 g. The brain tissue was homogenized with a solution of 50 mM Tris, pH 7.5. The final concentration of tissue in the homogenization buffer was 10% w/v. The homogenates were centrifuged at 1,000 x g for 10 min. in order to remove clumps of tissue and debris. The resulting supernatants were then centrifuged at 50,000 x g for 20 min. in order to sediment the membranes, which were next washed three times in homogenization buffer (50,000 x g for 20 min. each). The membranes were frozen and stored at -70°C until needed.

All compounds to be tested were dissolved in DMSO and then diluted into the binding buffer (50 mM Tris, pH 7.5) such that the final concentration was 2 µg/ml with 0.1% DMSO. Membranes were then added (400 µg of protein) to the reaction tubes. The reaction was started by the addition of 3 nM [<sup>3</sup>H]R-α-methyl histamine (8.8 Ci/mmol) or 3 nM [<sup>3</sup>H]N<sup>α</sup>-methyl histamine (80 Ci/mmol) and continued under incubation at 30°C for 30 min. Bound ligand was separated from unbound ligand by filtration, and the amount of radioactive ligand bound to the membranes was quantitated by liquid scintillation spectrometry. All incubations were performed in duplicate and the standard error was always less than 10%. Compounds that inhibited more than 70% of the specific binding of radioactive ligand to the receptor were serially diluted to determine a K<sub>i</sub> (nM).

Compounds of formula I have a K<sub>i</sub> within the range of about 0.1 to about 1000 nM. Preferred compounds of formula I have a K<sub>i</sub> within the range of about 0.1 to about 100 nM. More preferred compounds of formula I have a K<sub>i</sub> within the range of about 0.1 to about 20 nM. Example 1AI has a K<sub>i</sub> of 0.2 nM, Example 83 has a K<sub>i</sub> of 1.0 nM, and Example 10G has a K<sub>i</sub> of 3.9 nM.

General Procedure for rHu H<sub>3</sub> Binding Assay

[<sup>3</sup>H]N<sup>α</sup>-methylhistamine (82 Ci/mmol) was obtained from Dupont NEN. Thioperamide was obtained from the Chemical Research Department, Schering-Plough Research Institute.

5 HEK-293 human embryonic kidney cells stably expressing the human histamine H<sub>3</sub> receptor were cultured in Dulbecco's modified Eagle's medium/10% fetal calf serum/penicillin (100 U/ml)/streptomycin (100 µg/ml)/Geneticin (0.5 mg/ml) at 37° C in a humidified 5% CO<sub>2</sub> atmosphere. Cells were harvested between passages five and twenty at 37° C in 5 mM EDTA/Hank's balanced salt solution and  
10 processed for membrane preparation. After low-speed centrifugation, ten min at 1000 xg, they were put into ten volumes of ice-cold buffer and disrupted with a Polytron (PTA 35/2 tip, 30 sec at setting 6). After subsequent low-speed centrifugation, supernatant was centrifuged ten min at 50,000 xg. The high-speed pellet was resuspended in the original volume of buffer, a sample was taken for  
15 protein assay (bicinchoninic acid, Pierce) and the suspension was centrifuged again at 50,000 xg. Membranes were resuspended at 1 mg of protein/ml of buffer and frozen at -80° C until use.

Membrane (15 µg of protein) was incubated with 1.2 nM [<sup>3</sup>H]N<sup>α</sup>-methyl-histamine, without or with inhibitor compounds, in a total volume of 200 µl of buffer.  
20 Nonspecific binding was determined in the presence of 10<sup>-5</sup> M thioperamide. Assay mixtures were incubated for 30 min at 30° C in polypropylene, 96-well, deep-well plates, then filtered through 0.3% polyethylenimine-soaked GF/B filters. These were washed three times with 1.2 ml of 4° C buffer, dried in a microwave oven, impregnated with Meltilex wax scintillant and counted at 40% efficiency in a Betaplate  
25 scintillation counter (Wallac).

IC<sub>50</sub> values were interpolated from the data or were determined from curves fit to the data with Prism nonlinear least squares curve-fitting program (GraphPad Software, San Diego, CA). K<sub>i</sub> values were determined from IC<sub>50</sub> values according to the Cheng and Prusoff equation.

In this specification, the term "at least one compound of formula I" means that one to three different compounds of formula I may be used in a pharmaceutical composition or method of treatment. Preferably one compound of formula I is used.

Similarly, "at least one H<sub>1</sub> receptor antagonist " means that one to three different H<sub>1</sub> antagonists may be used in a pharmaceutical composition or method of treatment. Preferably, one H<sub>1</sub> antagonist is used.

For preparing pharmaceutical compositions from the compounds described by this invention, inert, pharmaceutically acceptable carriers can be either solid or liquid. Solid form preparations include powders, tablets, dispersible granules, capsules, cachets and suppositories. The powders and tablets may be comprised of from about 5 to about 95 percent active ingredient. Suitable solid carriers are known in the art, e.g. magnesium carbonate, magnesium stearate, talc, sugar or lactose. Tablets, powders, cachets and capsules can be used as solid dosage forms suitable for oral administration. Examples of pharmaceutically acceptable carriers and methods of manufacture for various compositions may be found in A. Gennaro (ed.), *The Science and Practice of Pharmacy*, 20<sup>th</sup> Edition, (2000), Lippincott Williams & Wilkins, Baltimore, MD.

Liquid form preparations include solutions, suspensions and emulsions. As an example may be mentioned water or water-propylene glycol solutions for parenteral injection or addition of sweeteners and opacifiers for oral solutions, suspensions and emulsions. Liquid form preparations may also include solutions for intranasal administration.

Aerosol preparations suitable for inhalation may include solutions and solids in powder form, which may be in combination with a pharmaceutically acceptable carrier, such as an inert compressed gas, e.g. nitrogen.

Also included are solid form preparations which are intended to be converted, shortly before use, to liquid form preparations for either oral or parenteral administration. Such liquid forms include solutions, suspensions and emulsions.

The compounds of the invention may also be deliverable transdermally. The transdermal compositions can take the form of creams, lotions, aerosols and/or emulsions and can be included in a transdermal patch of the matrix or reservoir type as are conventional in the art for this purpose.

Preferably the compound is administered orally.

Preferably, the pharmaceutical preparation is in a unit dosage form. In such form, the preparation is subdivided into suitably sized unit doses containing appropriate quantities of the active component, e.g., an effective amount to achieve the desired purpose.

The quantity of active compound in a unit dose of preparation may be varied or adjusted from about 1 mg to about 350 mg, preferably from about 1 mg to about 150 mg, more preferably from about 1 mg to about 50 mg, according to the particular application.

5           The actual dosage employed may be varied depending upon the requirements of the patient and the severity of the condition being treated. Determination of the proper dosage regimen for a particular situation is within the skill of the art. For convenience, the total daily dosage may be divided and administered in portions during the day as required.

10           The amount and frequency of administration of the compounds of the invention and/or the pharmaceutically acceptable salts thereof will be regulated according to the judgment of the attending clinician considering such factors as age, condition and size of the patient as well as severity of the symptoms being treated. A typical recommended daily dosage regimen for oral administration can range from about 1  
15 mg/day to about 300 mg/day, preferably 1 mg/day to 75 mg/day, in two to four divided doses.

          When the invention comprises a combination of H<sub>3</sub> antagonist and H<sub>1</sub> antagonist compounds, the two active components may be co-administered simultaneously or sequentially, or a single pharmaceutical composition comprising a  
20 H<sub>3</sub> antagonist and an H<sub>1</sub> antagonist in a pharmaceutically acceptable carrier can be administered. The components of the combination can be administered individually or together in any conventional dosage form such as capsule, tablet, powder, cachet, suspension, solution, suppository, nasal spray, etc. The dosage of the H<sub>1</sub> antagonist can be determined from published material, and may range from 1 to 1000 mg per  
25 dose.

          When separate H<sub>3</sub> and H<sub>1</sub> antagonist pharmaceutical compositions are to be administered, they can be provided in a kit comprising in a single package, one container comprising an H<sub>3</sub> antagonist in a pharmaceutically acceptable carrier, and a separate container comprising an H<sub>1</sub> antagonist in a pharmaceutically acceptable  
30 carrier, with the H<sub>3</sub> and H<sub>1</sub> antagonists being present in amounts such that the combination is therapeutically effective. A kit is advantageous for administering a combination when, for example, the components must be administered at different time intervals or when they are in different dosage forms.

While the present invention has been described in conjunction with the specific embodiments set forth above, many alternatives, modifications and variations thereof will be apparent to those of ordinary skill in the art. All such alternatives, modifications and variations are intended to fall within the spirit and scope of the present invention.

FURTHER INFORMATION CONTINUED FROM PCT/ISA/ 210

Continuation of Box I.2

Claims Nos.: 1-3(partially), 10-15(partially)

Present claims 1-3, 10-15 relate to an extremely large number of possible compounds. Support within the meaning of Article 6 PCT and/or disclosure within the meaning of Article 5 PCT is to be found, however, for only a very small proportion of the compounds, compositions and uses claimed. In the present case, the claims so lack support, and the application so lacks disclosure, that a meaningful search over the whole of the claimed scope is impossible. Consequently, the search has been carried out for those parts of the claims which appear to be supported and disclosed, namely those parts relating to the compounds relating to the compounds of formula I, for which y is not (CH<sub>2</sub>)<sub>4-5</sub> and A is a direct bond, M<sub>1</sub> is N, a=0, n=2, b=0 and the optional double point may be present. The search is complete for all examples in the description.

The applicant's attention is drawn to the fact that claims, or parts of claims, relating to inventions in respect of which no international search report has been established need not be the subject of an international preliminary examination (Rule 66.1(e) PCT). The applicant is advised that the EPO policy when acting as an International Preliminary Examining Authority is normally not to carry out a preliminary examination on matter which has not been searched. This is the case irrespective of whether or not the claims are amended following receipt of the search report or during any Chapter II procedure.

# INTERNATIONAL SEARCH REPORT

International application No.  
PCT/US 03/11696

## Box I Observations where certain claims were found unsearchable (Continuation of item 1 of first sheet)

This International Search Report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. ☐ Claims Nos.:  
because they relate to subject matter not required to be searched by this Authority, namely:
  
2. ☒ Claims Nos.: 1-3(partially), 10-15(partially)  
because they relate to parts of the International Application that do not comply with the prescribed requirements to such an extent that no meaningful International Search can be carried out, specifically:  
see FURTHER INFORMATION sheet PCT/ISA/210
  
3. ☐ Claims Nos.:  
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

## Box II Observations where unity of invention is lacking (Continuation of item 2 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. ☐ As all required additional search fees were timely paid by the applicant, this International Search Report covers all searchable claims.
  
2. ☐ As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.
  
3. ☐ As only some of the required additional search fees were timely paid by the applicant, this International Search Report covers only those claims for which fees were paid, specifically claims Nos.:
  
4. ☐ No required additional search fees were timely paid by the applicant. Consequently, this International Search Report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- ☐ The additional search fees were accompanied by the applicant's protest.
- ☐ No protest accompanied the payment of additional search fees.
